

entropic gateway: secondary errors vs N (EM-consistent reference; floor-free companion of e_F')

Equal total budget per arm per seed: $B = N \times n_steps = 3.2768e+09$ walker-steps at every N ($h = 2.5e-05$, $T_N = B\ h / N$); 32 seeds per (N , method). Secondary read-outs reported by the plan (not the primary endpoints). $e_F',stat = \text{RMS over the eval bins of } \Gamma - \text{bin-averaged } F'_ref$, so that $e_F'^2 = e_F',stat^2 + \text{floor}^2$ exactly: the descriptive companion of e_F' without its deterministic floor (no frozen threshold; the e_F' thresholds are drawn for scale).
