

ethane/LTA 150 K: secondary errors vs N (periodically projected mean force)

Equal total budget per arm per seed: $B = N \times n_steps = 3.072e+08$ walker-steps at every N ($h = 0.0002$, $T_N = B h / N$); 16 seeds per (N , method).
Secondary read-outs reported by the plan (not the primary endpoints).

ethane/LTA 150 K · S2s_secondary_reference_abs_vs_N · status: all planned (N , seed, method) complete · FR is not defined at $N = 1$ (ABF only, by design) · LTA $N < 50$: FR uses the finite- N cap extension $\max(1, \text{floor}(0.02 N))$.
Markers: seed median; whiskers: IQR over seeds; faint points: individual seeds. Grey lines: the frozen strict / mid / loose thresholds of $e(t)$ (shown for scale on the integrated errors as well).
