A5: age-dependent deposit bias (D2) vs λ and the young-clone manipulation check MC3
end snapshot; debiased RMS vs the bin-averaged F*' (reflected seed-bootstrap CI); matched excess = class error minus ABF error at the class's positions
N = 512: FR B_c by clone age; ABF B
debiased RMS bias B_c of deposits
transverse mobility λ
N = 512: young clones [0.01, 0.1) t.u.
young-clone matched excess over ABF
transverse mobility λ
N = 512: MC3 change from λ = 1
MC3: excess(λ) - excess(λ = 1)
transverse mobility λ
N = 128: FR B_c by clone age; ABF B
debiased RMS bias B_c of deposits
transverse mobility λ
N = 128: young clones [0.01, 0.1) t.u.
young-clone matched excess over ABF
transverse mobility λ
N = 128: MC3 change from λ = 1
MC3: excess(λ) - excess(λ = 1)
transverse mobility λ
FR, clone age [0,0.01) t.u.
FR, clone age [0.01,0.1) t.u.
FR, clone age [0.1,1) t.u.
FR, clone age >=1 t.u.
FR, never cloned
FR, all deposits
ABF, all deposits
MC3 passes (Holm p < 0.05, < 0)
MC3 does not pass
