

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.
Profile = the accepted scorer's read-out (exact integral of Gamma = M / (C + 1) at the 181 grid nodes), centred on the eval window like F_ref: the alignment e_F uses, identical for every method, seed and N. Top: profiles; bottom: difference (y-scale per column).
Dashed guides: region boundaries x = ±0.5 (left well / gate / right well); shaded |x| > 1.5: outside the scored eval window. Top-row y range = the reference over the scored window ± 35 % of its span (larger excursions are clipped there and show in the difference row).
No smoothing.
