Gateway family expA/shift_lam128 · N = 512 · T_N = 160 t.u.

n_steps = 6,400,000 · h = 2.5e-05 · B = N n_steps = 3.277e+09 walker-steps · complete seeds: ABF 32/32, ABF+FR 32/32

FR genealogy and activity vs budget fraction u

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.
FR cap = 40 events per opportunity (the historical gateway rule max(1, floor(0.08 N)), floor included); genealogy window 1.6 t.u.; ABF: ESS and family sizes undefined (each walker its own lineage), unique ancestors = N (blue line in e).
Events per opportunity: realised deaths (filled, when the engine saves them) and capped candidates kd + kc (outline); seed-pooled whole-run histogram, log scale.
