gateway shift_lam128: convergence curves on the normalised budget axis, selected N

Equal total budget per arm per seed: B = N × n_steps = 3.2768e+09 walker-steps at every N (h = 2.5e-05, T_N = B h / N);
32 seeds per (N, method). Common axes per row; every column spends the same B.

gateway shift_lam128 · S7_convergence_selected_N · status: all planned (N, seed, method) complete · FR is not defined at N = 1 (ABF only, by design).
Selected N: largest planned N; the middle of the sorted planned ladder (index len//2); the smallest N with an FR arm; N = 1 -- chosen from the PLAN, independent of the data (duplicates dropped).
Lines: median over seeds at every save (24 log-spaced u < 5e-3, the 200 uniform u, physical checkpoints); bands: IQR. Grey lines (labelled at the right): frozen thresholds (dotted strict, dashed mid, dash-dot loose; TV_half solid) and the far-state target / ½ target.
