

D2(i) clone-age composition of the force deposits: I:  $\alpha = 0.5$  (half the log-omega entropy moved into the energy;  $\text{Var}(f(x)) / 4$ ),  $N = 128$   
 Cumulative fractions at the snapshots (seed median, IQR; ABF+FR  $n = 32$ ). ABF never clones: its deposits are all 'never cloned'. y ranges (a-c) shared by every cell of this experiment at this  $N$ , capped at 1.
