

gateway lam0.1: convergence curves on the normalised budget axis, selected N

Equal total budget per arm per seed: $B = N \times n_steps = 3.2768e+09$ walker-steps at every N ($h = 2.5e-05$, $T_N = B \cdot h / N$); 32 seeds per (N , method). Common axes per row; every column spends the same B .

gateway lam0.1 · S7_convergence_selected_N · status: all planned (N, seed, method) complete · FR is not defined at $N = 1$ (ABF only, by design).
Selected N: largest planned N; the middle of the sorted planned ladder (index $\text{len}/2$); the smallest N with an FR arm; $N = 1$ -- chosen from the PLAN, independent of the data (duplicates dropped).
Lines: median over seeds at every save (24 log-spaced $u < 5e-3$, the 200 uniform u , physical checkpoints); bands: IQR. Grey lines (labelled at the right): frozen thresholds (dotted strict, dashed mid, dash-dot loose; TV_half solid) and the far-state target / $\frac{1}{2}$ target.
