

Establishment and crossings vs physical time

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC\_PLAN section-4 quantities, unsmoothed.  
Establishment (frozen): first save after which the instantaneous far-state fraction (right well  $x > 0.5$ ) stays  $\geq \frac{1}{2}$  of its uniform target 0.361; the cumulative-visitation version uses C\_all (far-state bins) against  $\frac{1}{2}$  of their bin share. True events never count a copy (clones inherit labels).  
Null calibration at N = 2048: an EXACTLY uniform population (far count  $\sim \text{Bin}(N, 0.361)$  per save) fails the instantaneous criterion at a save with  $p = 1.74e-72$  and passes every save of the second half with  $P = 1.000$ .
