Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.

Markers: first save after which the seed-MEDIAN curve stays at or below the threshold at every later save (persistent crossing of the median curve; the per-seed tau statistics are in summary.json). Censored thresholds have no marker; 'cens. a | b' next to each threshold = seeds whose own tau is censored (never persistently met by u = 1), ABF | ABF+FR.

Errors over the full circle (180 bins); Gamma = M / max(C, 1) from the production accumulators once they hold counts (else all-steps), as core_lta reports.
