

Ethane/LTA 300 K · N = 64 · T_N = 960 t.u.

steps = 4,800,000 · h = 0.0002 · B = N n_steps = 3.072e+08 walker-steps · complete seeds: ABF 16/16, ABF+FR 16/16

Free-energy error e_F vs physical time

ABF (n = 16) interquartile range —□— mid threshold MC reference noise (RMS of the per-tau statistics)

ABF+FR (n = 16) strict threshold —△— loose threshold

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.

Markers: first save after which the seed-MEDIAN curve stays at or below the threshold at every later save (persistent crossing of the median curve; the per-seed tau statistics are in summary.json). Censored thresholds have no marker; 'cens. a | b' next to each threshold = seeds whose own tau is censored (never persistently met by $u = 1$), ABF | ABF+FR.

Errors over the full circle (180 bins); Gamma = $M / \max(C, 1)$ from the production accumulators once they hold counts (else all-steps), as core_lta reports.
