

Entropic gateway · N = 128 · T_N = 640 t.u.

n_steps = 25,600,000 · h = 2.5e-05 · B = N n_steps = 3.277e+09 walker-steps · complete seeds: ABF 32/32, ABF+FR 32/32

Mean-force snapshots (bin mean force) vs reference (top) and difference (bottom)

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.

Bin mean force Gamma = M / (C + 1) (step) vs the analytic F' (curve); bottom: Gamma minus the bin average of F'_ref, whose RMS over the eval window is the floor-free companion e_F'_stat; e_F'^2 = e_F'_stat^2 + floor^2, floor = 0.03227 (the within-bin variation of F'_ref: a hard lower bound of e_F', not visible in this row). Empty bins read 0 (estimator convention).

Dashed guides: region boundaries x = ±0.5 (left well / gate / right well); shaded |x| > 1.5: outside the scored eval window. Top-row y range = the reference over the scored window ± 35 % of its span (larger excursions are clipped there and show in the difference row).

No smoothing.
