

Ethane/LTA 150 K · N = 16 · T_N = 3840 t.u.

n_steps = 19,200,000 · h = 0.0002 · B = N n_steps = 3.072e+08 walker-steps · complete seeds: ABF 16/16, ABF+FR 16/16

Cumulative visitation histograms (C_all, normalised) at the snapshot u

— ABF (n = 16) — ABF+FR (n = 16) — interquartile range — uniform target

Line = median across seeds; band = interquartile range (25th-75th percentile) across seeds. Metrics are the frozen SCIENTIFIC_PLAN section-4 quantities, unsmoothed.

Cumulative visitation $C_{\text{all}}(t)$ (every deposit since the start, all walkers) normalised per seed, on the 180 production bins; median + IQR across seeds. Values below 0.001 (including empty bins) are drawn at 0.001.

Dashed guides: $|\phi| = 0.791$ rad (window $|z| < 1.5$ Å) and $|\phi| = 2.109$ rad (cage $|z| > 4$ Å), $z = |\phi| a / 2\pi$, $a = 11.919$ Å.
