

D2(iii) class-wise conditional force variance: $\text{ll: } \lambda = 1$ (original gateway), $N = 2048$

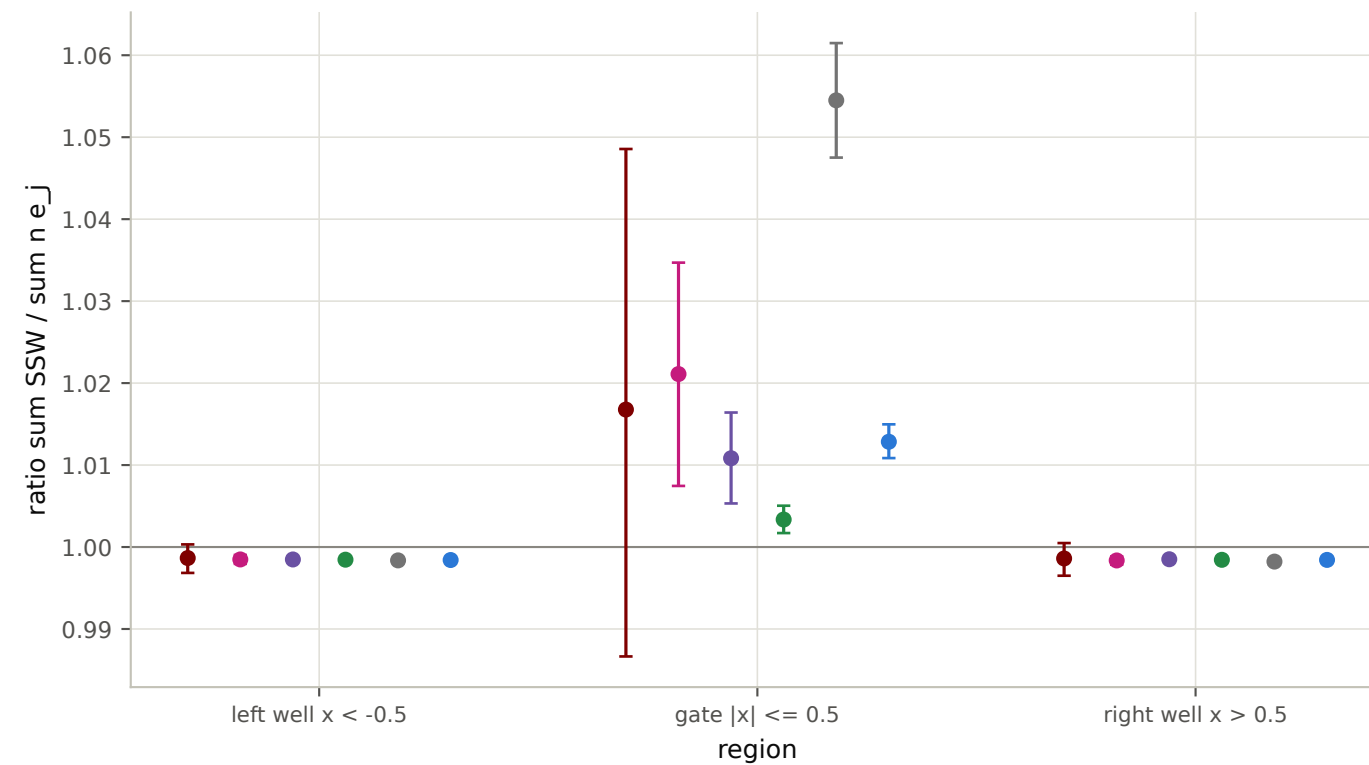

Within-bin variance of the deposited force pooled over seeds vs the exact $(2\alpha^2/\beta^2)(w'/w)^2$ (shift: $(2/\beta^2)(w'/w)^2$) bin average plus the within-bin variance of F^* ; bands (a) and error bars (b): 95 % seed-bootstrap CIs.

EXPLORATORY: this quantity is not preregistered (SCIENTIFIC_PLAN sections 4 and 6)

(a) within-bin variance of f per clone-age class

(b) measured / exact within-bin variance (eval window)

— clone age $[0,0.01]$ t.u. — clone age $[0.1,1]$ t.u. — never cloned x exact e_j , deposit-weighted over the 0.1 bin (compare with the curves) ····· exact $\langle \text{Var}(f|x) \rangle_{\text{bin}}$
— clone age $[0.01,0.1]$ t.u. — clone age ≥ 1 t.u. — ABF (all deposits) — exact $e_j = \langle \text{Var}(f|x) \rangle + \text{Var}(F^* | \text{bin}), 0.02$ bins (a, b) 95 % seed-bootstrap CI
