

D2(ii) clone-age composition of the force deposits: I: $\alpha = 1$ (original gateway: entropic barrier share 3.47 kT), $N = 128$
 Cumulative fractions at the snapshots (seed median, IQR; ABF+FR $n = 32$). ABF never clones: its deposits are all 'never cloned'. y ranges (a-c) shared by every cell of this experiment at this N , capped at 1.
