

D2(i) clone-age composition of the force deposits: I: shifted fibre, kappa = 1 (variance-matched control; constant width, curved slow fibre), N = 128
 Cumulative fractions at the snapshots (seed median, IQR; ABF+FR n = 32). ABF never clones: its deposits are all 'never cloned'. y ranges (a-c) shared by every cell of this experiment at this N, capped at 1.
