

D2(iii) class-wise conditional force variance: I: shifted fibre, $\kappa = 1$ (variance-matched control; constant width, curved slow fibre), $N = 128$
 Within-bin variance of the deposited force pooled over seeds vs the exact $(2\alpha^2/\beta^2)(w'/w)^2$ (shift: $(2/\beta^2)(w'/w)^2$) bin average plus the within-bin variance of F^* ; bands (a) and error bars (b): 95 % seed-bootstrap CIs.

EXPLORATORY: this quantity is not preregistered (SCIENTIFIC_PLAN sections 4 and 6)
