

D2(i) clone-age composition of the force deposits: I: shifted fibre, $\kappa = 1$ (variance-matched control; constant width, curved slow fibre), $N = 512$
 Cumulative fractions at the snapshots (seed median, IQR; ABF+FR $n = 32$). ABF never clones: its deposits are all 'never cloned'. y ranges (a-c) shared by every cell of this experiment at this N , capped at 1.
