

—●— Plain ABF —■— Physical-target FR

Best observed schedule (diagnostic; pilot gate not passed)

Median and IQR; $n = 8$ matched seeds; $\gamma = 0.1$, window $0.2T$ -- $0.3T$, stride 20; gray = FR active; ancestral $\text{ESS}/K = 0.185 < 0.50$

Panel (c) diagnoses transient allocation; after FR turns off, plain ABF drives its biased marginal back toward flat.
