

ethane/LTA 300 K: convergence curves for ALL N (supplementary)

Equal total budget per arm per seed: $B = N \times n_steps = 3.072e+08$ walker-steps at every N ($h = 0.0002$, $T_N = B \cdot h / N$); 16 seeds per (N , method). Seed medians on the normalised budget axis; colour = N (light = small N).

ethane/LTA 300 K · S7s_convergence_all_N · status: all planned (N , seed, method) complete · FR is not defined at $N = 1$ (ABF only, by design) · LTA $N < 50$: FR uses the finite- N cap extension $\max(1, \text{floor}(0.02 N))$.
Every planned N is listed in the legends (bottom row); an N without curves is greyed with its status. Right column: median FR curve / median ABF curve at the same N (below 0 = FR lower).
