

WCA dimer: replica-time trade-off at a fixed number of force evaluations $B = 4.915\text{e}+08$ per arm (160 bins, 16 seeds per N) [dt 0.0005; e_F vs v2 TI reference]

(a) error vs normalised budget

(b) Fisher-Rao benefit vs number of replicas

(c) which (N, T) split is best at fixed budget
